• Site Overview

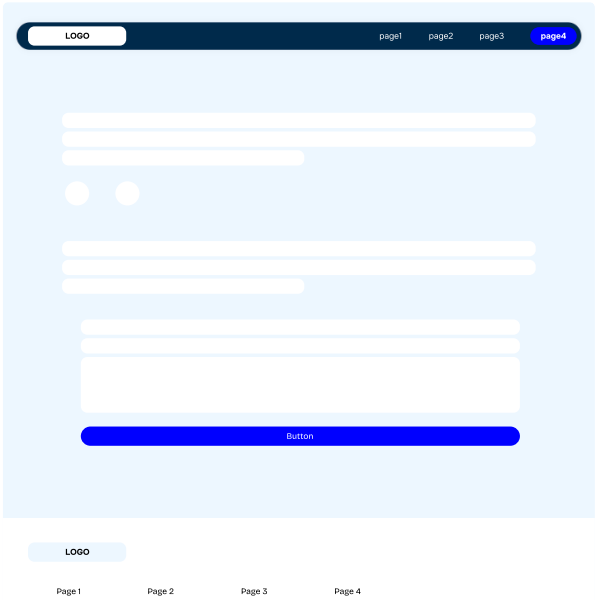

My portfolio website contains a home page (index.html) where I introduce myself very briefly with a hero image that draws attention, a linked preview of my previous work and a footer to reach out to other pages for further convenient navigation. Next, an *About Me* page (About.html) should be part of the website, which displays my educational and experience background so far. Subsequently a work page (work.html) follows up and indicates three significant cases which transfer capabilities. For contact purposes, a contact page (Contact.html) is added to the website, which reflects contact details and a form for a more direct sort of contact. The future steps should include a more in-depth insight into the work cases. More content should accompany the cases. Furthermore, a JavaScript-driven tracking must be implemented into each Call-to-Action element. Crucial legal requirements should be considered and implemented on the website (e.g., a cookie banner).

• Design Outline

My idea of a portfolio was to create something unique, something that conveys professionalism but at the same time trust through personality. Blue is typically the colour for trust. For this reason, I added a light blue colour to the background. But a subtle light blue alone is too invisible and meaningless. Therefore, I added a vibrant, bold blue as an accent colour to create a clear contrast that supports legibility and trust simultaneously. Other than that, the strong blue feels energetic and should convey willingness to start projects and conquer challenges. To clearly display that the user will discover work in the digital industry, I integrated *Michroma* for the headlines that perfectly represent modern tech or digital in general. For pleasant reading purposes, I integrated *Onest* as the major font for body text, captions, sublines and more. To reduce overstimulation, I decided to lower the number of colours and fonts and focus on images, text and buttons. Next to the background and accent colour, I stayed in the blue colour pattern and just added a dark blue background to the top navigation bar. This creates an unambiguous contrast, which helps the user to find the navigation bar immediately. Furthermore, I added a regular white background colour to the footer, which helps to indicate it more precisely. To picture a modern website, I constantly rounded the corners of rectangles. This is how I designed the frames of the images or the capsules for the buttons, to achieve a modern look like Apple's design language. I used CSS Flexbox to arrange horizontal or vertical even alignments. That allowed me to structure the work cases, for instance, to make it more legible and improve visibility. I also added a huge padding (150px) to each page's content for better understanding where the content starts and ends. Whilst I made the Headlines stand out with a bigger font size, I simultaneously reduced the size of the body text and reduced the size of the captions even more. For feedback purposes, I implemented hover effects such as colour transitions in the navigation or footer index or a cursor change while hovering over buttons.
